

# Stamp Perforation Gauge

**Print at 100% / "Actual size" (no "fit to page").** Then check the calibration bar at the bottom measures exactly 100 mm with a ruler. To use: lay a stamp edge along a row of dots and slide until the holes line up with the dots — the number on the left is the gauge (holes per 2 cm). Measure all four sides; different gauges across vs. down means a compound perforation.
